                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cc invention. The peptides of the invention have: (a) cytolytic activity on cpathogenic cells (pathogens and malignant cells not naturally present in cc the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse can be used to treat infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) cor cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as capricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides concersed resistance to proteolytic degradation. Non-haemolytic, concertainly, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, we resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New non-haemolytic cytolytic agent useful in treating cancer infections - is a peptide comprising a moiety which disrupts

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              breaker moiety, or a peptide (or cyclic derivative of this) which (comprises L-amino acid residues and D-amino acid residues, has a net positive charge greater than I and has an amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.

The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix
                                                                                                       (AMGE-) AMGEN INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC fc domain, pharmacologically active peptides, and linkers. Where (1) is:

(C (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each

(C independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2.

(C (L1)c-P1-(L2)d-P2-(L3)e-P3.) or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4

(C where P1, P2, P3, and P4 = are each independently sequences of

(C pharmacologically active peptides; L1, L2, L3, and L4 = are each independently

(C independently linkers; and a, b, c, d, e, and f = are each independently

(C or 1, provided that at least 1 of a and b is 1. The composition can

(C have cytostatic, antiasthmatic, thrombolytic and immunosuppressive

(C activities. DNAs, vectors and host cells from the present invention can

(C be used for producing pharmaceutical compositions. The compositions are

(C activities. DNAs, vectors and host cells from the present invention sare

(C activities of an Fc domain (rather than a Fab domain) can provide a longer

(C The use of an Fc domain (rather than a Fab domain) can provide a longer

(C half-life or incorporate functions such as Fc receptor binding, protein

(C honding, complement fixation, and possibly placental transfer. AAA69443

(C to AAA69526 and AAB16955 to AAB19003 represent nucleotide and amino acid

infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as agricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha helical structures) means that the peptides have few if any toxic effects, and those that include D-aa will have increased resistance to proteolytic degradation. Non-haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Sinc these random copolymers induce total lysis of bacterial cell walls, resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oren
                                                                                                                                                                                                                                                                                              pathogenic cells (pathogens and malignant cells not naturally present in the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse pathogens. The peptides, their complexes and mixtures are used to treat pathogens.
                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a Leu/Lys diastereomer peptide of the invention. The peptides of the invention have: (a) cytolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide(s) having selective cytolytic activity - against pathogens and malignant cells, but no haemolytic activity, used for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC This sequence represents a Leu/Lys diastereomer peptide of the CC invention. The peptides of the invention have: (a) cytolytic activity on pathogenic cells (pathogens and malignant cells not naturally present in CC concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentrations (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as concentratives for food, cosmetics and agricultural produce, or as concentratives for food, cosmetics and agricultural produce, or as concentrative for alpha-helical structures) means that the peptides concentrative for alpha-helical structures) means that the peptides concentrated they few if any toxic effects, and those that include D-aa will have concentrated to the proteolytic degradation. Non-haemolytic, concentrated concentration copolymers of pardaxin, each has a specific spectrum of contivity, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, since consistence to them is unlikely to dawning.
                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a corresponding amino acid sequence comprising only 1-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present peptide is used to produce the agents of the invention. The specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and alpha-helix (comprises L-amino acid residues and alpha-helix (comprises L-amino acid residues) has a net positive charge greater than 1 and has an amino acid sequence such that positive charge greater than 1 and has an amino acid sequence such that a corresponding amino acid sequence such that

peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix breaker molety, or a peptide (or cyclic derivative of this) which (comprises L-amino acid residues and D-amino acid residues, has a net positive charge greater than 1 and has an amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of The present peptide is used to produce the agents of the invention. The specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a pentide which has a continuous control of a complex control of a control of the used as disinfectants for destruction of microorganisms, i.e. is solutions for wetting contact lenses, as preservatives, e.g., it commetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products. cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infection. They may also they may be used in both human and veterinary medicine. They may also infections. may also be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein a binding, complement fixation, and possibly placental transfer. AAA6943 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino. acid sequences used in the exemplification of the present invention.

cc independently selected from -(L1)c-P1, -(L1)d-P2-(L3)d-P3-(L4)f-P4
cc (L1)c-P1-(L2)d-P2-(L3)e-P^3, or (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4
cc where P1, P2, P3, and P4 = are each independently sequences of
cc pharmacologically active peptides; L1, L2, L3, and L4 = are each independently
cc independently linkers; and a, b, c, d, e, and f = are each independently
cc or 1, provided that at least 1 of a and b is 1. The composition can
cc have cytostatic, antiasthmatic, thrombolytic and immunosuppressive
cc activities. DNAs, vectors and host cells from the present invention can
cc be used for producing pharmaceutical compositions. The compositions are
cc useful for treating cancer, asthma, thrombosis, or autoimmune diseases.
cc The use of an Fc domain (rather than a Fab domain) can provide a longer
cc half-life or incorporate functions such as Fc receptor binding, protein
cc A binding, complement fixation, and possibly placental transfer. AAA69443
cc to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid
cc sequences used in the exemplification of the present invention.

This created by binding 5 created by binding 5 copies of this sequence to peptide 23 (see AAW35149). The peptides of the invention have: (a) cytolytic activity on pathogenic cells (pathogens cand malignant cells not naturally present in the body); but (b) no complex of the invention have: (a) cytolytic activity only at a concentration complex of the complex of complex of the complex of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT

                                                                                                                                                                Ş
                                                                                                                                                                                                                                                                                                                                                              CC pathogenic cells. The agent is selected from a cyclic derivative of a corpetide which has a net positive charge greater than 1 comprises L-amino CC acid residues and/or D-amino acid residues and comprises an alpha-helix CC breaker molety, or a peptide (or cyclic derivative of this) which CC (comprises L-amino acid residues and D-amino acid residues, has a net CC (comprises L-amino acid residues and D-amino acid sequence such that CC positive charge greater than 1 and has an amino acid sequence such that CC is not found in nature. The cytolytic agents may be used for treatment of CC cancer or for treatment of several diseases caused by pathogens, CC including bacterial, fungal, viral, mycoplasma and protozoan infections. CC They may be used in both human and veterinary medicine. They may also be CC used as disinfectants for destruction of microorganisms, i.e. in CC cosmetic and food industries, as preservatives, e.g., in the CC cosmetic and food industries, as pesticides (e.g. fungicides or cCC bactericides) or for preservation of agricultural products.

Oncogene 18:7026-7033(1999).
-i- FUNCTION: INHBUTS D53- AND P73-MEDIATED CELL CYCLE ARREST AND APOPTOSIS BY BINDING ITS TRANSCRIPTIONAL ACTIVATION DOMAIN.
FUNCTIONS AS AN UBIQUITH LIGASE E3, IN THE PRESENCE OF E1 AND TOMARD P53 AND ITSELF. PERMITS THE NUCLEAR EXPORT OF P53 AND TARGETS IT FOR PROTEASOME-MEDIATED PROTEDLYSIS (BY SIMILARITY).
-i- COPACTOR: ZINC IS REQUIRED FOR UBIQUITIN LIGASE E3 ACTIVITY (BY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TOWARD P53 AND ITSELF. PERMITS THE NUCLEAR EXPORT OF P53 AND TARGETS IT FOR PROTEASOME-MEDIATED PROTEOLYSIS.

-!- COFACTOR: ZINC IS REQUIRED FOR UBIQUITIN LIGASE E3 ACTIVITY. SUBUNIT: BINDS P53, P73, ARF(P14), RIBOSOMAL PROTEIN L5 AND SPECIFICALLY TO RNA. CAN INTERACTS ALSO WITH RETINOBLASTOMA PROTEIN (RB), E1A-ASSOCIATED PROTEIN P300 AND THE E2F1

TRANSCRIPTION FACTOR.
-!- SUBCELLULAR LOCATION: NUCLEAR AND CYTOPLASMIC. EXPRESSED PREDOMINANTLY IN THE NUCLEOPLASM. INTERACTION WITH ARF(P14) RESULTS IN THE LOCALIZATION OF BOTH PROTEINS TO THE NUCLEOLUS. THI NUCLEOLAR LOCALIZATION SIGNALS IN BOTH ARF(P14) AND MDM2 MAY BE DEFORMED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         THE THYMUS, SPLEEN, AND INTESTINE, THE LEVELS OF ALL MANDESTINE THYMUS, SPLEEN, AND INTESTINE, THE LEVELS OF ALL MANDESTINE THE THYMUS, SPLEEN, AND INTESTINE, THE LEVELS OF ALL MANDESTINE EQUIVALENT.

INDUCTION: BY UV LIGHT.

INDUCTION: BY UV LIGHT.

DOMAIN: REGION I IS SUFFICIENT FOR BINDING P53 AND INHIBITING ITS G1 ARREST AND APOPTOSIS FUNCTIONS. IT ALSO BINDS P73 AND E2F1.

REGION II CONTAINS MOST OF A CENTRAL ACIDIC REGION REQUIRED FOR INTERACTION WITH RIBOSOWAL PROTEIN L5 AND A PUTATIVE C4-TYPE ZING FINGER. THE RING FINGER DOMAIN WHICH COORDINATES TWO MOLECULES OF PRESENT AND MEDIATES THE HETERO-OLIGOMERIZATION WITH MIDM4. IT IS ALSO ESSENTIAL FOR ITS UBIQUITIN LIGASE E3 ACTIVITY TOWARD P53 AND ARMA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CELL LINE.
SIMILARITY: CONTAINS 1 RING-TYPE ZINC FINGER.
SIMILARITY: CONTAINS 1 RANBP2-TYPE ZINC FINGER.
SIMILARITY: BELONGS TO THE MDM2 / MDM4 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DEPENDENT MANNER DISEASE: THE GENI

C-1- FUNCTION: INHIBITS P53- AND P73-MEDIATED CELL CYCLE ARREST AND CI-1- FUNCTION: INHIBITS P53- AND P73-MEDIATED CELL CYCLE ARREST AND CREATED BY BINDING ITS TRANSCRIPTIONAL ACTIVATION DOMAIN.

CC FUNCTIONS AS AN UBLOUITIN LICASE B3, IN THE PRESENCE OF E1 AND E2, TOWARD P53 AND ITSELF. PERMITS THE NUCLEAR EXPORT OF P53 AND CC TARGETS IT FOR PROTEASOME-MEDIATED PROTEOLYSIS.

CC -1- COPACTOR: ZINC IS REQUIRED FOR UBLOUTIN LICASE E3 ACTIVITY.

CC -1- COPACTOR: ZINC IS REQUIRED FOR UBLOUTIN LICASE E3 ACTIVITY.

CC -1- SUBUNIT: BINDS P53, P73, ARF(P14), RIBOSOMAL PROTEIN L5 AND SPECIFICALLY TO RNA. CAN INTERACTS ALSO WITH RETINOBLASTOMA CREDITION FACTOR.

CC -1- SUBCIFICALLY TO RNA. CAN INTERACTS ALSO WITH RETINOBLASTOMA CREDITION FACTOR.

CC -1- COPACTOR: CRB), E1A-ASSOCIATED PROTEIN POOLASMIC. EXPRESSED CREDITION FACTOR.

CC -1- SUBCELLULAR LOCATION: NUCLEAR AND CYTOPLASMIC. EXPRESSED CREDITS IN THE LOCALIZATION OF BOTH PROTEINS TO THE NUCLEOLUS. THE NUCLEOLAR LOCALIZATION OF BOTH PROTEINS TO THE NUCLEOLUS. THE NUCLEOLAR LOCALIZATION SIGNALS IN BOTH ARF(P14) AND MDM2 MAY BE NUCLEOLAR LOCALIZATION SIGNALS IN BOTH ARF(P14) AND MDM2 MAY BE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sharp D.A., Kratowicz S.A., Sank M.J., "Stabilization of the MDM2 oncoprotein structurally related MDMX protein.";
                               DEPENDENT MANNER.

IDESCASE: SEEMS TO BE AMPLIFIED IN CERTAIN TUMORS (INCLUDING SOFT TISSUE SARCOMAS, OSTEOSARCOMAS AND GLIOMAS). A HIGHER FREQUENCY C SPLICE VARIANTS LACKING P53 BINDING DOMAIN SEQUENCES WAS FOUND IN LATE-STAGE AND HIGH-GRADE OVARIAN AND BLADDER CARCINOMAS. FOUR OF THE SPLICE VARIANTS SHOW LOSS OF P53 BINDING.

I-MISCELLANEOUS: MDM2 RING FINGER MUTATIONS THAT FAILED TO UBIQUITINATE P53 IN VITRO DID NOT TARGET P53 FOR DEGRADATION WHEN EXPRESSED IN CELLS.

I-SIMILARITY: CONTAINS 1 RING-TYPE ZINC FINGER.

I-SIMILARITY: BELONGS TO THE MDM2 / MDM4 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Levine A.J., Pavleticn w.r., "Structure of the MDM2 oncoprotein bound "Structure Annain.";

                                                                                                                                                                                                                                                                                                 DOMAIN: REGION I IS SUFFICIENT FOR BINDING P53 AND INHIBITING ITS G1 ARREST AND APOPTOSIS FUNCTIONS. IT ALSO BINDS P73 AND E2F1.

REGION II CONTAINS MOST OF A CENTRAL ACIDIC REGION REQUIRED FOR INTERACTION WITH RIBOSOMAL PROTEIN L5 AND A PUTATIVE C4-TYPE ZINC FINGER. THE RING FINGER DOMAIN WHICH COORDINATES TWO MOLECULES OF ZINC INTERACTS SPECIFICALLY WITH MICH COORDINATES TWO MOLECULES OF RESENT AND MEDIATES THE HETERO-OLIGOMERIZATION WITH MICH. IT IS RESENT AND MEDIATES THE UBIQUITIN LIGASE E3 ACTIVITY TOWARD P53 AND SESSENTIAL FOR ITS UBIQUITIN LIGASE E3 ACTIVITY TOWARD P53 AND MEDIATES THE MEDIATION WITH MICH.
